---

## PROFESSIONAL SUMMARY

Senior Backend Engineer with 6+ years of experience designing and scaling distributed systems, microservices architectures, and event-driven pipelines using Golang, Apache Kafka, and AWS/Kubernetes. Proven track record in high-traffic platforms (Rappi, Boletia) and modernizing legacy architectures. Highly proficient in accelerating engineering velocity and SDLC through AI-assisted development (Cursor, Copilot, Gemini) and AI-driven Product/Technical Requirements Documents (PRDs/TRDs).

## WORK EXPERIENCE

### Itti — Senior Software Engineer

*Jun 2025 – Present*

- Architected a resilient geospatial scraping platform in Go utilizing Hexagonal Architecture and concurrency patterns (Worker Pools, Goroutines, Channels).
- Accelerated engineering velocity by integrating AI-assisted coding workflows (Cursor, GitHub Copilot, Gemini), significantly reducing boilerplate generation and time-to-market for complex microservices.
- Authored comprehensive AI-driven Product and Technical Requirements Documents (PRDs/TRDs), mapping out edge cases, database schemas, and implementation plans to streamline cross-functional development cycles.
- Engineered a multi-level caching layer with Redis Geospatial and PostgreSQL (PostGIS / GIST indexes), improving query response times by 1,000x and decreasing redundant API requests by 75%.
- Designed distributed rate limiting using the Token Bucket algorithm in Redis, integrating dynamic proxy rotation and Circuit Breaker patterns (Exponential Backoff, Jitter) to achieve an 85%+ scraping success rate.

### Boletia México — Senior Backend Developer

*Feb 2022 – May 2025*

- Designed and deployed a high-concurrency ticket purchase and resale engine in Go, decoupling transactions with Apache Kafka to handle peak sales traffic without system degradation.
- Implemented distributed transaction management using the Saga Pattern and Event Sourcing, guaranteeing eventual consistency across order, checkout, and inventory domains.
- Hardened Kafka infrastructure on Kubernetes by configuring SASL/TLS authentication, role-based ACLs, and fine-tuning batching, Snappy/Gzip compression, and log retention to minimize latency.
- Mentored and led a cross-functional squad of 4 developers, standardizing code review practices, CI/CD pipelines, and SOLID architectural principles.

### Rappi — Backend Developer

*Jul 2019 – Jan 2022*

- Led the decomposition and migration of a legacy Node.js monolith into Golang microservices, improving throughput and stabilizing service availability for millions of daily active users.
- Engineered the core slot allocation engine (vasito logic) for couriers and shoppers, optimizing route efficiency, distance algorithms, and real-time operational capacity mapping.
- Implemented event-driven communication via Kafka producers and consumers in Go, streamlining asynchronous task processing across fulfillment and logistics services.

## TECHNICAL SKILLS

- Languages & Frameworks: Golang, Node.js, JavaScript, TypeScript, Next.js, React.js
- Architecture & Patterns: Microservices, Event-Driven Architecture (EDA), Hexagonal Architecture, Saga Pattern, Event Sourcing, SOLID
- Data & Messaging: Apache Kafka, PostgreSQL, PostGIS, Redis, MongoDB, DynamoDB, Elastic Cloud
- AI & Engineering Tools: Cursor, GitHub Copilot, Gemini, AI-assisted PRD/TRD writing.
- Cloud & DevOps: AWS (Lambda, API Gateway, SQS, SNS, S3, CDK, CloudFormation), Kubernetes, CI/CD, Git
